

Kronik Total Oklüzyon Girişim Teknikleri

Prof. Dr. Ömer Göktekin
Bezmialem Vakıf Üniversitesi
Tıp Fakültesi

CTO Görüntülenmesi

➤ Stump ve distal giriş noktasının saptanmasında en iyi görüntülerin tanımlanması

➤ Simultane Kontralateral Enjeksiyon

➤ Kılavuz telin ilerletilmesinde biplane anjiyografi

CTO teknikleri

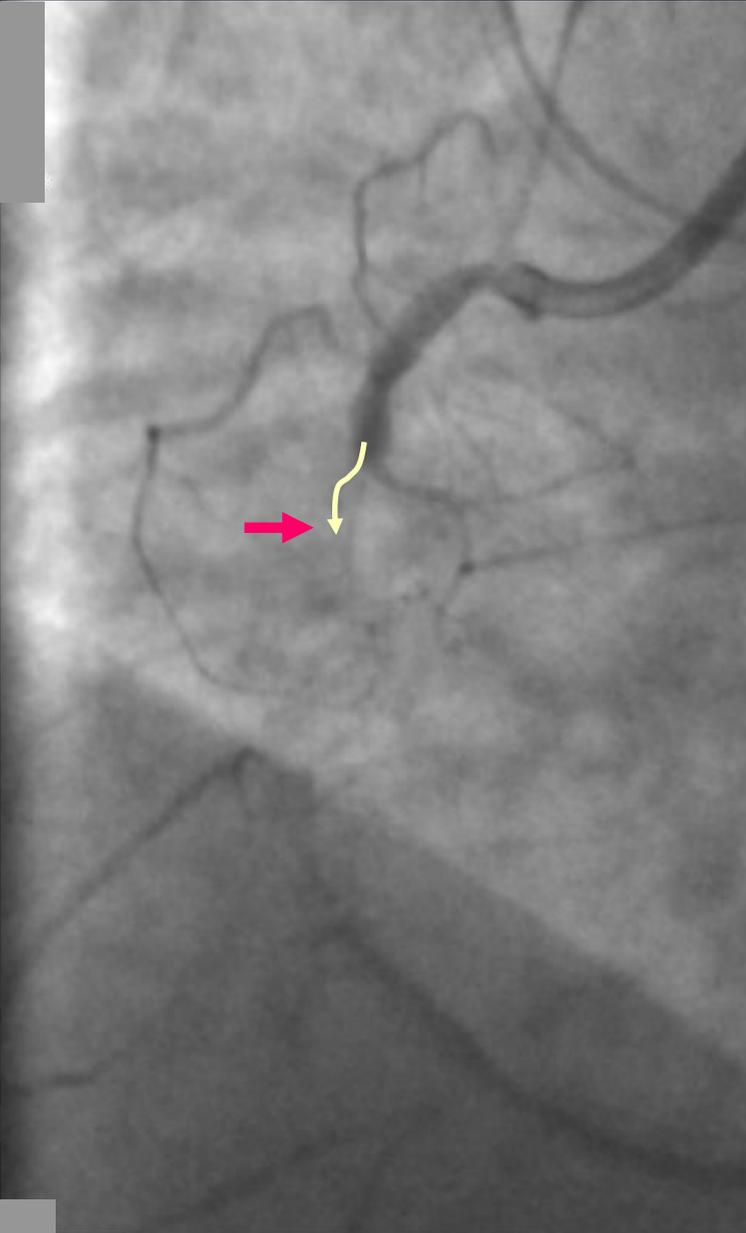

- 1. Antegrad teknikler**
- 2. Retrograd teknikler**
- 3. Yardımcı yöntemler**
 - Tornus
 - Rotablator
- 4. Özel cihazlar**
 - Lumend frontrunner
 - SafeCross

Kontralateral Enjeksiyonun İşlevi

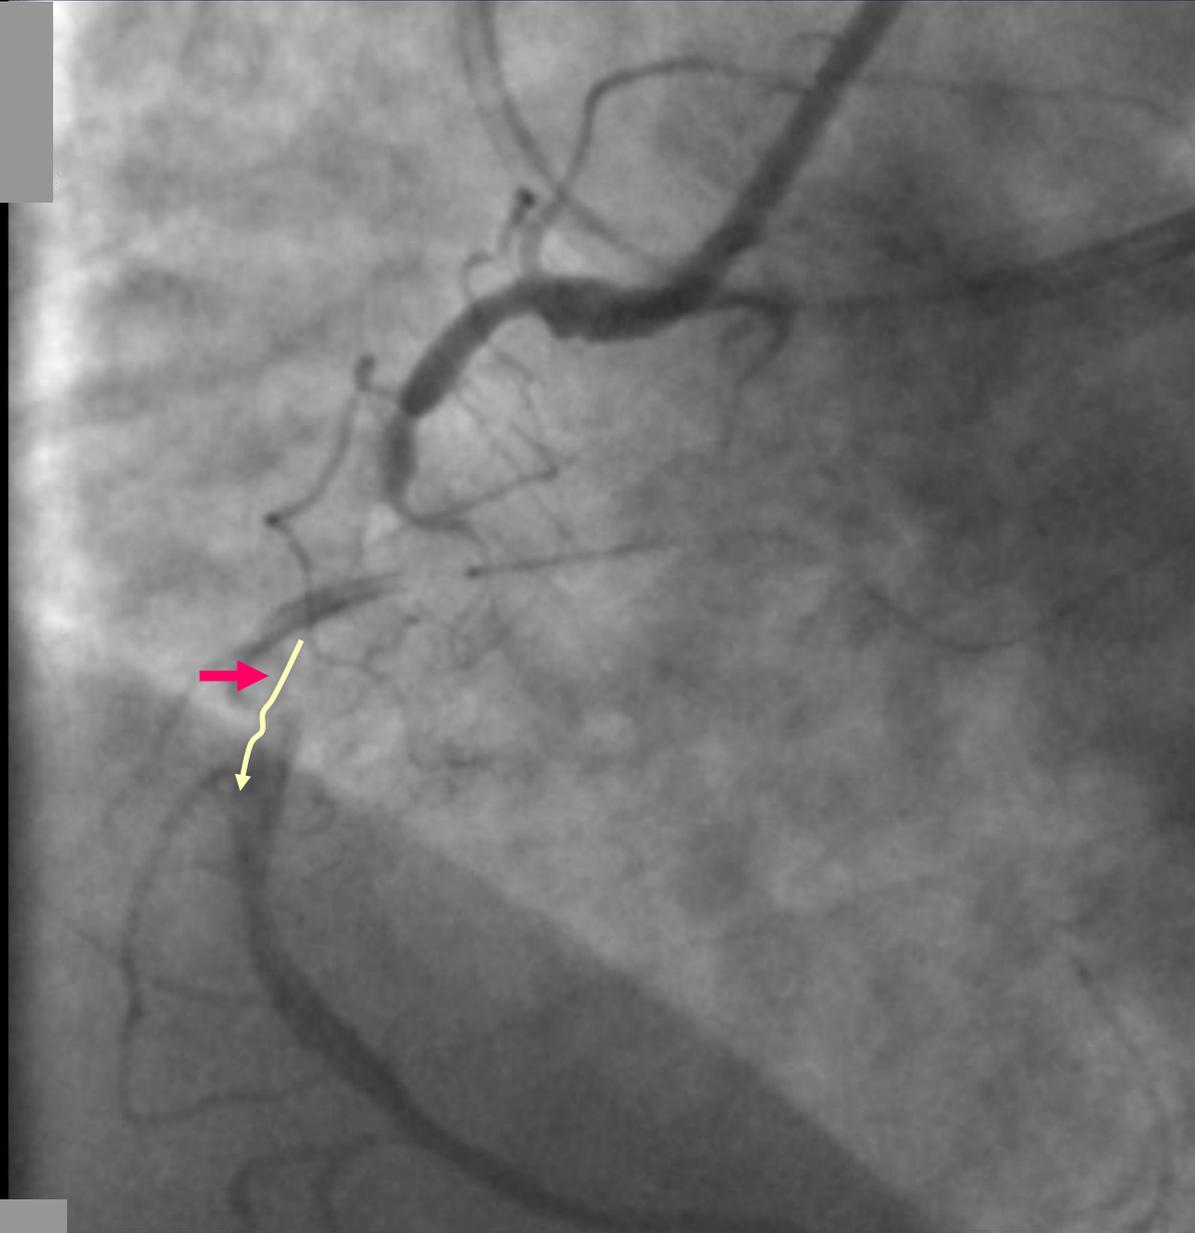

- CTO distali diğer koroner damardan kolletaral dolum gösteriyorsa, kontrallateral enjeksiyon gereklidir
- Super-selective kontralateral enjeksiyon daha net imajların alınması ve kontrast kullanımının azaltılması açısından çok faydalıdır.

Mikrokanallar belirlenmelidir

Stump olması antegrad mikrokanal varlığının önemli bir göstergesidir

Fielder XT and Fielder FC

Fielder XT

Fielder FC

Antegrad Mikro Kanallar

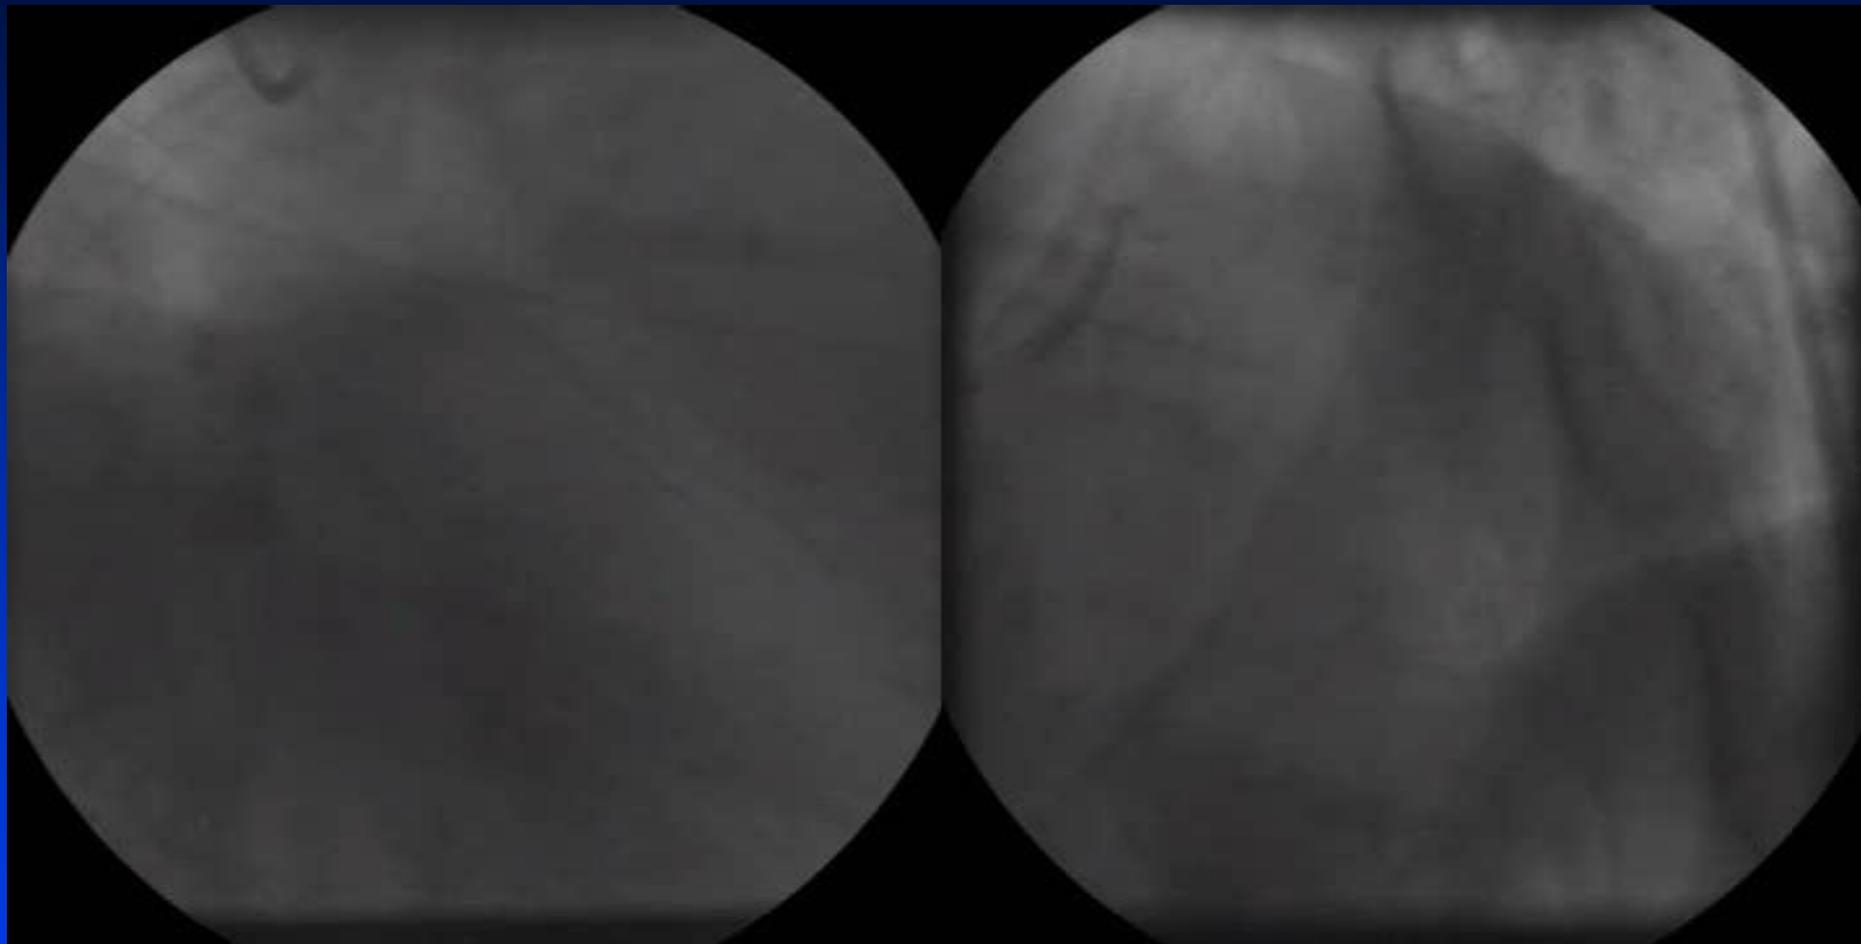

- **Patolojik antegrad mikro kanallar sıklıkla anjiyografide görünmezler**
- **Antegrad mikro kanallar her zaman gerçek distal lümenle devamlılık göstermezler. Bazen vaza vazorum ile ilişkilidirler**
- **Antegrad mikro kanallar mı ve köprü kolleteraller mi olduğuna karar vermek çok zor bir konudur**

Antegrad Mikro Kanalları Geçmek İçin Uygun Tel Seçimi

- **Tel antegrad mikrokanallardan kısa süre içinde geçebilmelidir**
- **Hiç antegrad mikrokanal yoksa, tel yalancı lümenine geçmemeli, gerçek lümen içinde kalmalıdır**

Antegrad Mikrokanal Yokluğunda Stump'ın Penetrasyonu

CTO - Milieu Considerations

- **Planned procedure – not “ad hoc”**
 - **Careful assessment of symptoms, and target site viability + ischemia (“righteous” indication)**
- **Proper diagnostic angiograms**
 - **Must visualize collaterals and distal parent vessel beyond the CTO segment (consider bilateral angiography during diagnostic procedure)**
- **Strong guiding catheter support**
 - **7-8 Fr, trans-femoral preferred for antegrade**
 - **Sideholes for RCA and small ostial LM**
- **Bilateral angiography from the outset in essentially ALL cases**
- **Obsessive management of radiation exposure and contrast volume**

CTO - Milieu Considerations

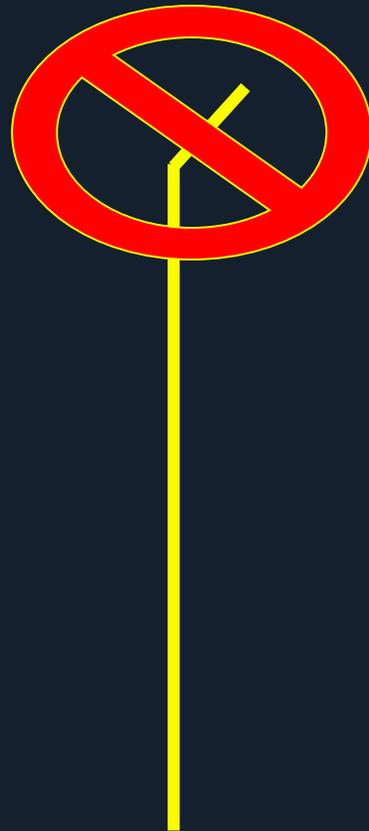

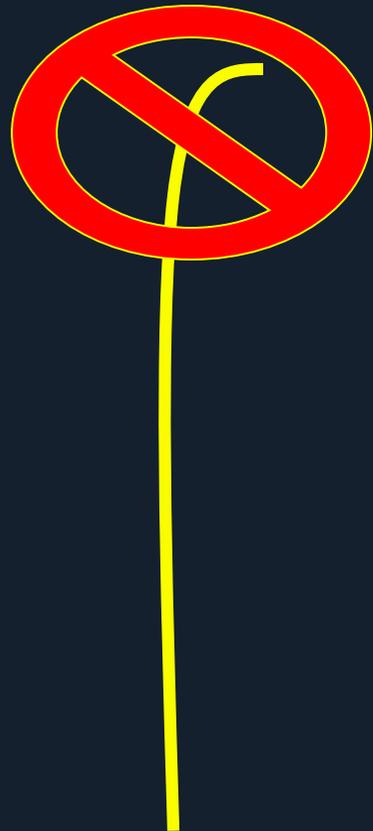

- **Heparin anticoagulation**
 - **No bivalirudin and keep ACTs 200-250 secs**
- **Patient comfort**
 - **Adequate sedation and foley catheter**
- **Other factors**
 - **Access issues (consider long sheaths)**
 - **Status of pericardium (post-CABG issues)**
- **ZEN philosophy**
 - **Spiritual adventure – you cannot be “beaten” by the vessel – persistence reigns supreme (consider 2nd attempts)**
 - **Patience, patience, patience...**
 - **Experience, experience, experience...**

Is There a Time NOT to Try ?

Maybe...

- **Long Tortuous CTO Segment Gap**
- **Severe Calcification**
- **Poor Distal Vessel Visualization**
- *Esp. when, no prospect for retrograde recanalization*

CTO Guidewires – Tip Shaping

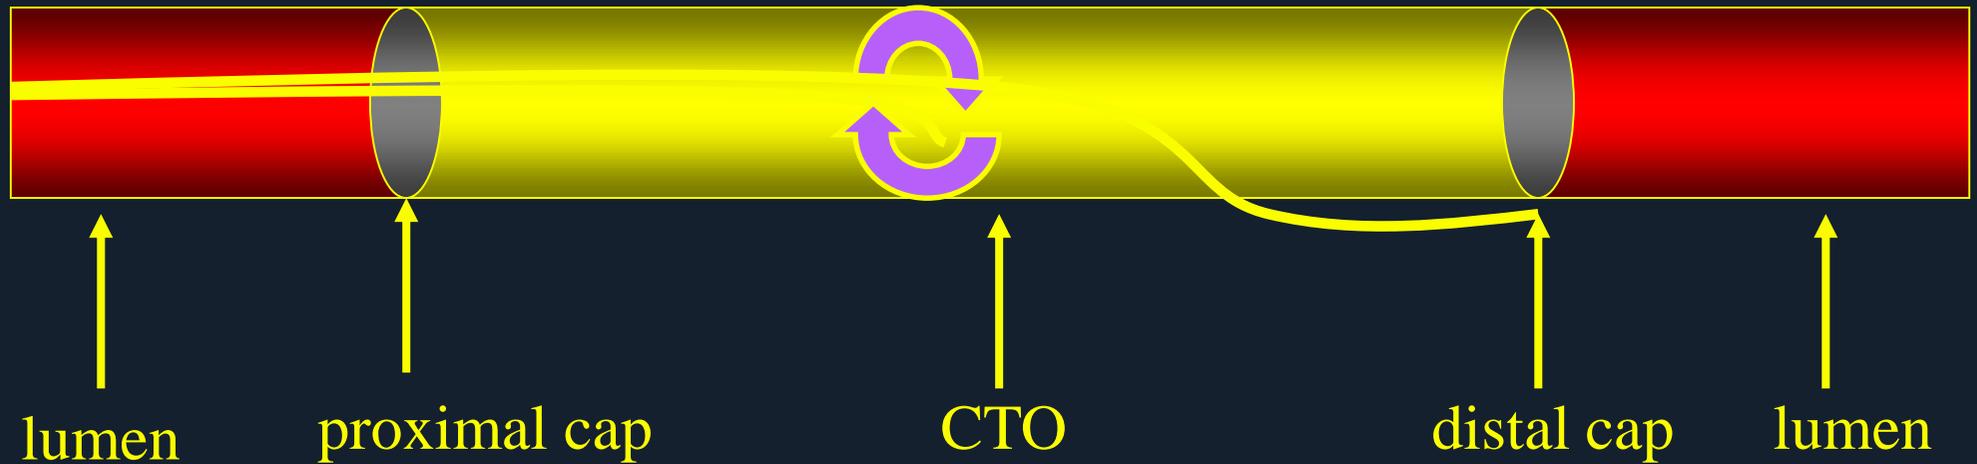

Primary bend ~ $<30^\circ$
1-2mm from tip

Secondary
bend ~ $10-15^\circ$

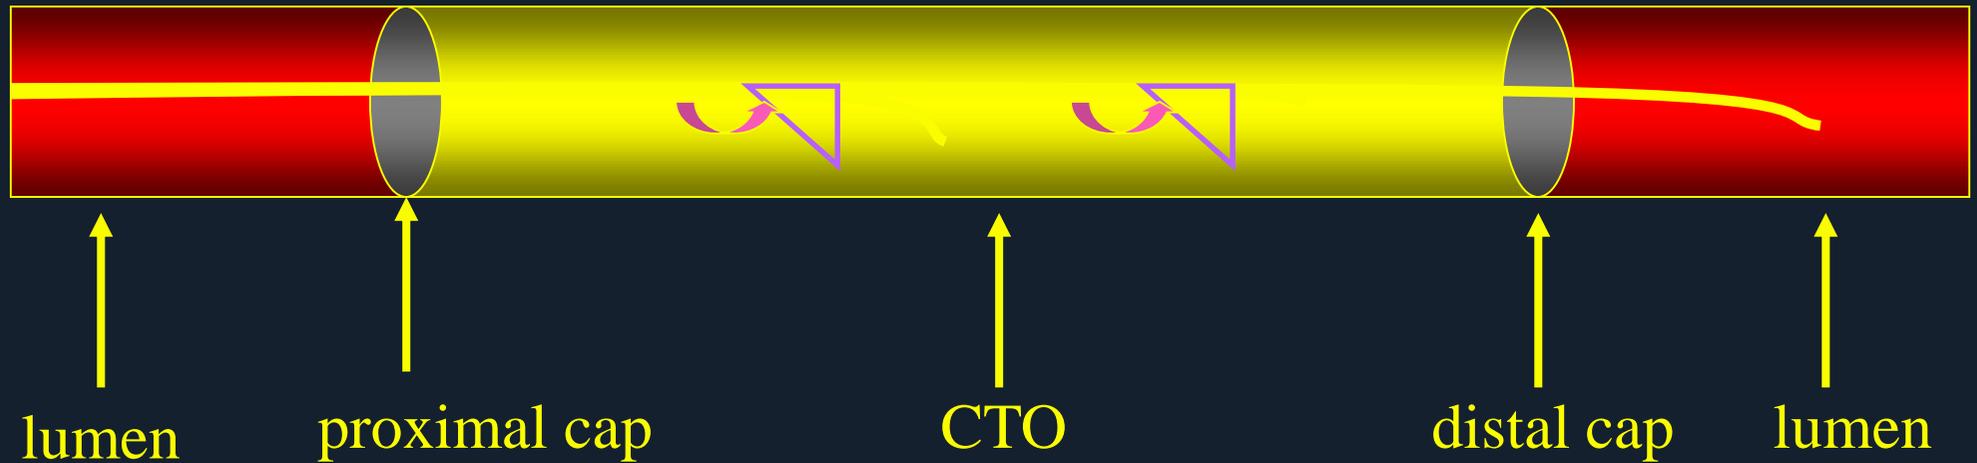

Antegrade CTO Wiring Techniques

Uncontrolled drilling

FAILURE!

Antegrade CTO Wiring Techniques

Controlled Drilling
(90 degree arc)

Guidewire Operator Techniques

DRILLING (controlled)

- Short tip curve (~ 2mm) at 30°; sometimes a proximal secondary curve at 10-15°
- Controlled rotational 90° arc tip motion with gentle forward probing
- Start with moderate stiffness tips and stepwise increases in tip stiffness
- Premium on tactile responses

CTO Guidewire Categories

DRILLING
(controlled)

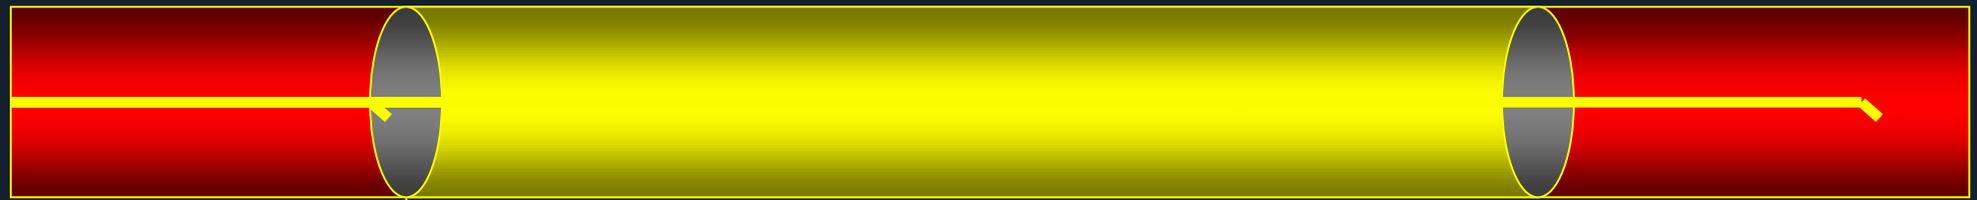

- Abbott CROSS-IT wires (100, 200, and 300) **X**
- Asahi MIRACLE Bros wires (3-12 gm)
- Medtronic PERSUADER wires (3 and 6 gm)

Lesion-Specific CTO Approaches

DRILLING (controlled)

- Most CTOs with discrete entry point; after initial attempt with soft or hydrophilic wires
- “Workhorse” technique
- Parallel wiring technique

Antegrade CTO Wiring Techniques

↑
lumen

↑
proximal cap

↑
lumen

Penetration Technique

Guidewire Operator Techniques

PENETRATION

- Similar tip shape and curves as drilling technique
- Precise movements of the guidewire tip
- Minimal rotational tip motion with more aggressive directed forward probing
- Tip stiffness (+ taper) should penetrate even heavily calcified entry cap (9-12 gms)
- Reduced tactile responsiveness

CTO Guidewire Categories

PENETRATION

- Abbott CROSS-IT 400
- Asahi-Abbott CONFIENZA wires (regular and PRO)
- 9 and 12 gm
- Medtronic PERSUADER wire - 9 gm

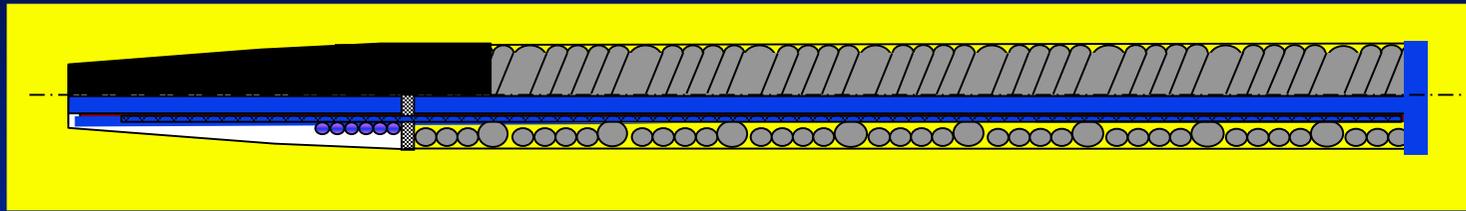

Lesion-Specific CTO Approaches

PENETRATION

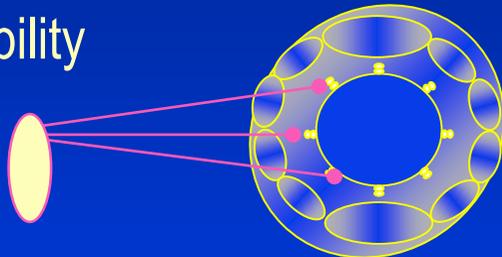

- Blunt entry point, short straight CTO segments
- Heavily calcified or resistant lesions
- Alternative to “drilling” after initial soft wire failure or after “drilling” wire failure
- Parallel wiring technique

Corsair Micro-catheter

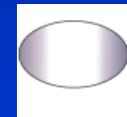

For crossing & dilating small vessels: SHINKA Shaft

Tungsten braids for visibility

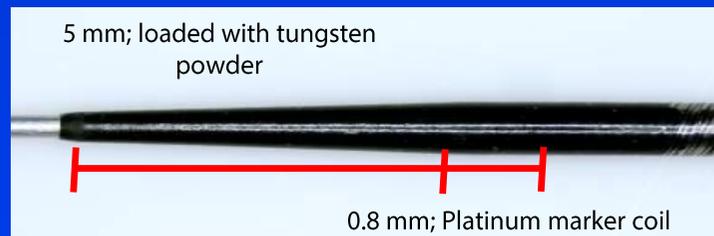

$\Phi 0.12$ mm x 2pcs

$\Phi 0.07$ mm x 8pcs

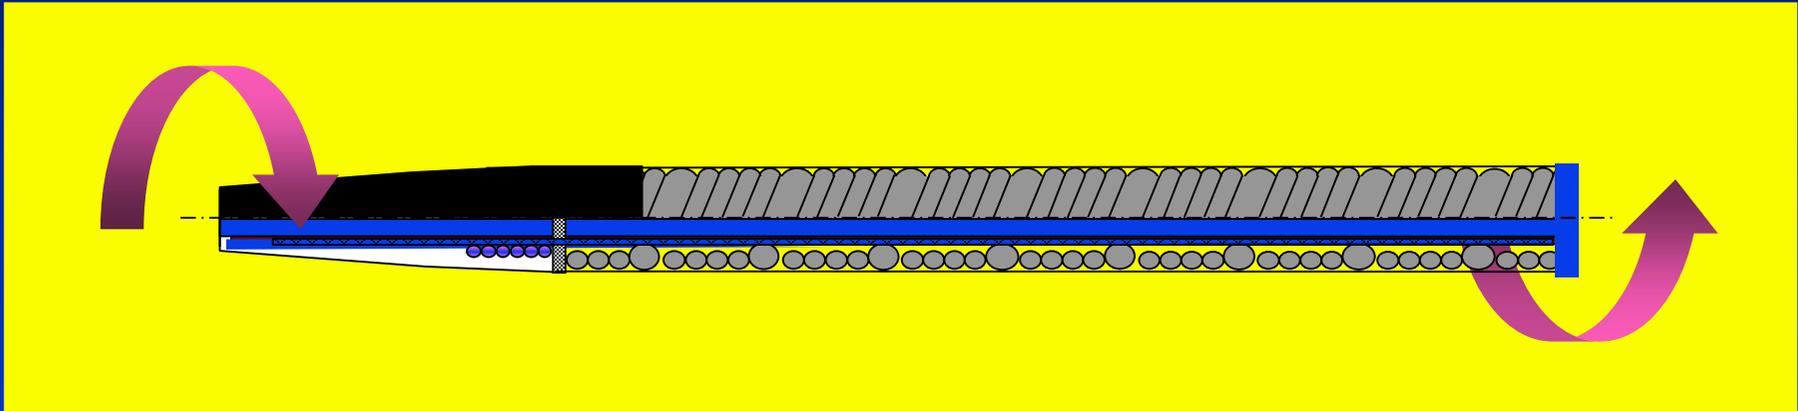

8 thin wires wound with 2 larger ones = pushability, trackability and support.

Corsair Micro-catheter

Also for antegrade crossing as support catheter

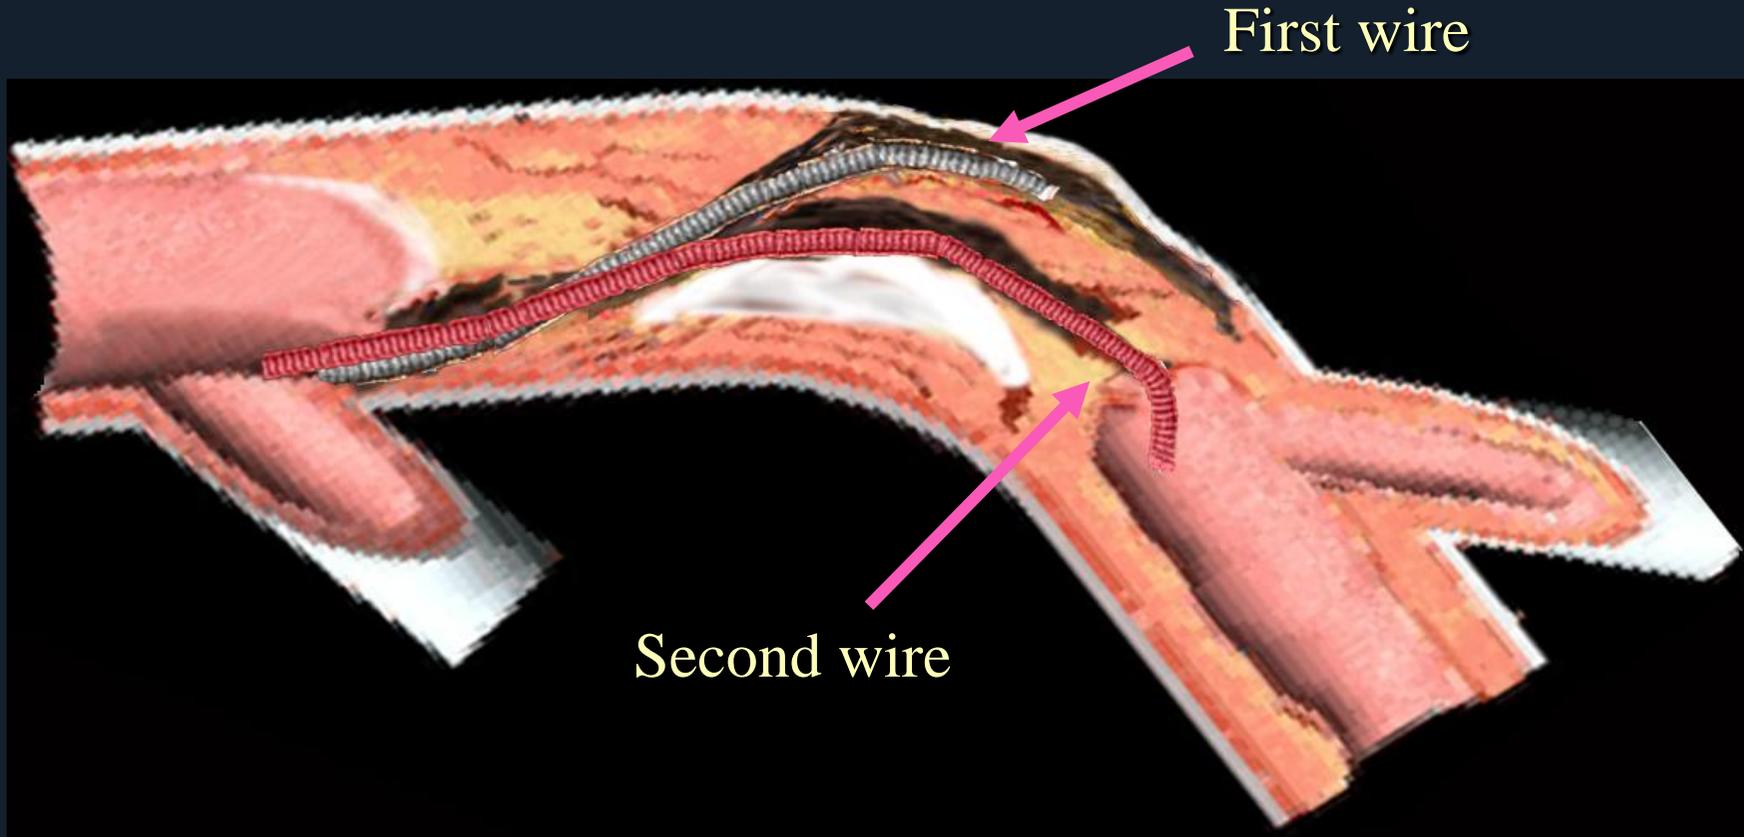

Rotation Resistance Reduction

SHINKA-Shaft's spiral structure transmits rotation to the distal tip. This rotation gives CORSAIR its crossing performance through tortuous channels.

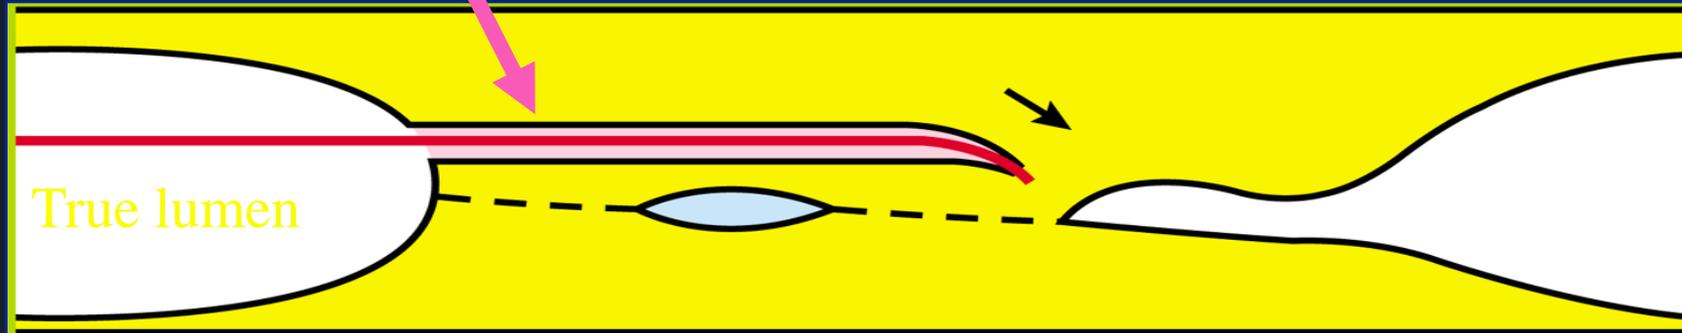

Antegrade CTO Wiring

Parallel wire technique

Guidewire Re-entry from Subintimal Space

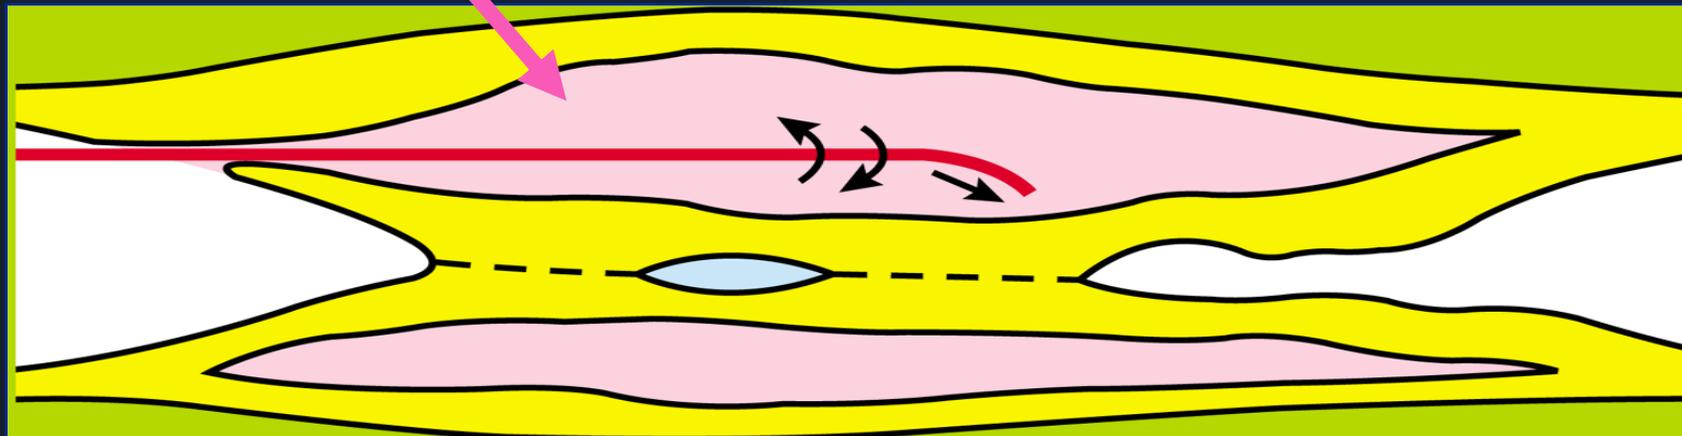

Small false lumen

True lumen

Large false lumen

Easy to make re-entry

Difficult to make re-entry

CTO Guidewires – Tip Shaping

For penetrating the entry point

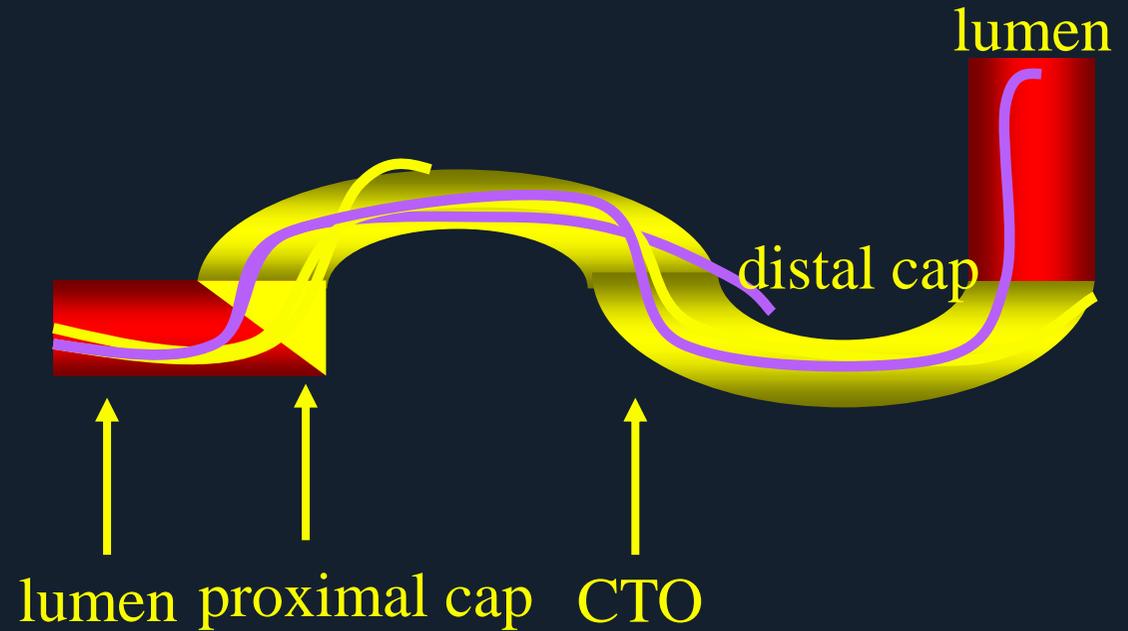

For reentering to the true lumen from the subintima

Antegrade CTO Wiring Techniques

Severe Tortuosity

Four CTO Summits (2004–2007)

Failure Modes (N=11)

CTO - Procedural Considerations

When You Can't Cross (wire)

- **Advanced wiring techniques**
 - **Escalate, penetrate, parallel, see-saw**
- **Advanced support techniques**
 - **Guiding catheters, micro-catheters (Finecross), anchor balloon, mother-in-child, Tornus**
- **IVUS guidance**
- **Retrograde technique**
 - **Evaluate feasibility during planning stages**
 - **Crossover sooner than later**

CTO - Procedural Considerations

When You Can't Cross (balloon)

- **Advanced PCI techniques**
 - **Buddy wire, lowest profile balloons, etc.**
- **Advanced support techniques**
 - **Guiding catheters, anchor balloons**
- **Crossing devices**
 - **Tornus or channel dilator (Corsair)**
 - **Excimer laser**
 - **Rotational atherectomy**
- **Retrograde technique**

CTO - Procedural Considerations

When to STOP!

- **Wire or device perforation with pericardial effusion**
- **Hemodynamic instability**
- **Collateral vessel compromise**
- **Extensive dissection compromising distal runoff**
- **Contrast threshold**
- **Radiation threshold**
- **“CSP” = CTO Saturation Point – futility threshold**
 - **Stage for second attempt**
 - **Refer to more experienced operator**

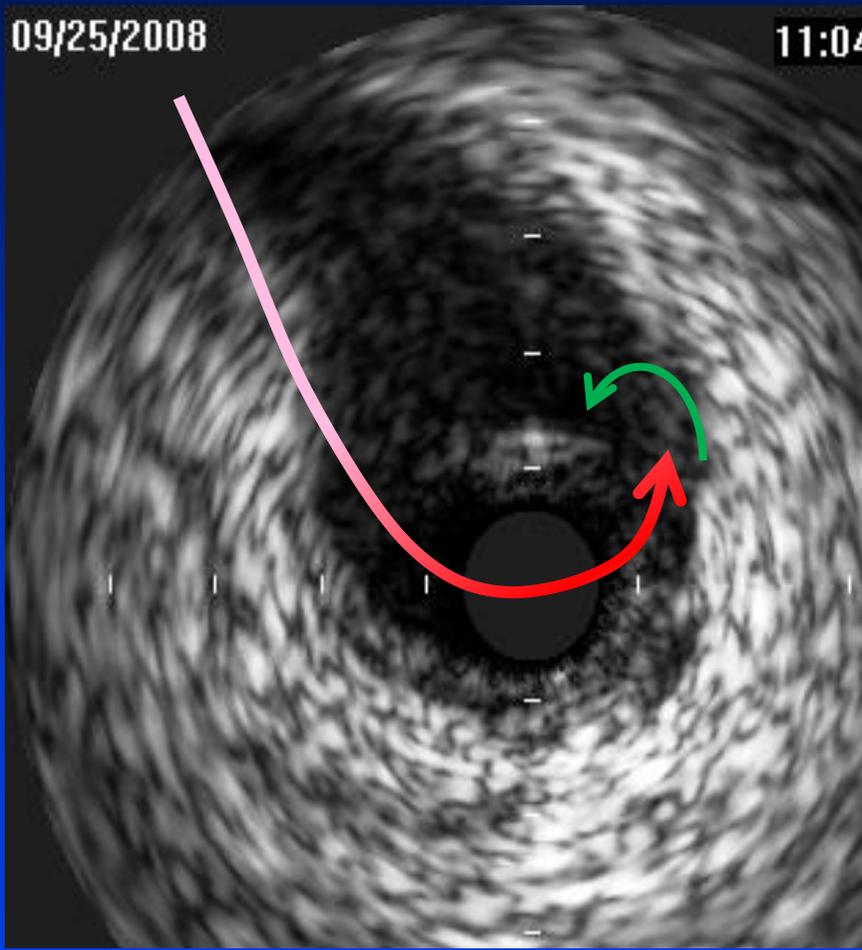

CTO - Procedural Considerations

Recent TRENDS

- **Increased use of early hydrophilic wires (Fielder)**
- **Rapid wire escalation (“hybrid” strategies)**
- **Anchor balloon techniques for support**
- **Use of Tornus and channel dilator**
- **IVUS assisted situations**
- **Early and more frequent initial retrograde approach**
- **CTA assistance (and co-registration – future)**
- **DES – DES – DES – under most circumstances**
- **2nd attempts are now commonplace**

Identification of re-entry
point from subintimal
space

Identification of the entry
site

Conclusions

- Perform good quality images to assess presence of microchannels
- Evaluate distal bed with bilateral coronary angiography
- Use multiple projections to visualize progression of guide wires
- Use appropriate guide wires for specific type of lesions, by the help of microcatheters & OTW support balloons
- Select the most easier reasonable technique to start
- Be ready to switch from one antegrade technique to another antegrade technique, as well as from antegrade to retrograde techniques or viceversa
- Be ready to adopt different techniques during the same procedure
- Take time and be Zen, and always follow carefully advices from your “Mentor”
